

instructBrain

IB-PLAN-001 · REV 1 · ACTION PLAN

What we do next, in order

Eleven steps, each one listed separately, with whose job it is and when it is done

ISSUED	OWNER	PRODUCT	SOURCE
7 Oct 2026	D. Hopwood	instructBrain	Repo <code>c8a2252</code> , checked 7 Oct 2026

Two things to hold in mind before you start. **Nothing done on Mon 6 Oct is live yet** - it is all in the repository, waiting on one Publish press. And every item below was checked against the code or the live site today, not copied from last night's notes.

Step 0 is the whole ballgame. Fifteen commits - the findings wording, the Pro plan name, the Finding labels - are pushed and invisible. Press **Publish → Update** in Lovable and they are in front of your users. Everything else on this list is smaller than that one click.

1 The whole plan, at a glance

#	STEP	WHO	SIZE	WHY IT MATTERS
0	Press Publish → Update in Lovable	YOU	1 min	Goes live: findings copy, Pro plan, Finding labels
1	Location: one prompt, not two	ME	small	The one you keep hitting
2	Letterhead stops repeating itself	ME	small	Two identical lines on every report header
3	Dashboard stops hiding the work	ME	small	Recent reports and Overdue load collapsed
4	All reports gets a create action	ME	small	No way to start a report from the list
5	Test, lint, push - then you publish	ME	same day	Four separate commits
6	The two old reports both saying 001	YOU	decision	Pre-date the reference builder
7	Delivery webhooks not configured	YOU	needs a URL	Bounces are not recorded today
8	Sign-in emails on a shared sender	YOU	needs SMTP	Wants your own domain
9	IB-WALK-002 - the write-up	ME	half a day	Branded document, hosted link
10	Re-walk after publishing	ME	same day	Proof, not an assumption

2 Now - one click

0	One click, and Monday's work goes live	YOU	1 minute
WHAT	Everything I finished on Mon 6 Oct is pushed to the repo but is not in front of your users . The live site is running an older build.		
PROOF	Your live pricing card still reads "Practice £99" . The code says Pro . I checked both just now.		
DO THIS	Open instructBrain in Lovable and press Publish → Update .		
DONE WHEN	The pricing card says Pro and the app says Finding instead of Snag.		
THEN I CHECK	I re-read the live bundle and confirm the words actually changed, rather than take the button's word for it.		

3 The four fixes I can do without you

1	Location: one prompt, not two	ME	small
WHAT'S WRONG	The photograph offers "Add a location tag (optional)" , but leave it blank and it shows an amber "Not yet completed" chip - so it reads as required. The report then derives its own location from those same fields. Two voices asking for one thing, with nothing explaining how they relate. This is the one that catches you every time.		
WHERE	<code>photos-panel.tsx:688</code> , <code>capture-fields-form.tsx:50</code> , <code>report-document-view.tsx:1088</code>		
WHAT I'LL DO	Make the state honest and single-voiced: one place asks for the location, the chip stops contradicting the label, and the report says plainly where its location came from.		
DONE WHEN	A tester cannot be confused about whether a location is needed, or which one the report will print.		

2 Report letterhead stops printing the same words twice

ME small

WHAT'S WRONG	The eyebrow prints the template name, and directly beneath it the title prints the same template name again plus the date.
WHERE	<code>report-document-view.tsx:280</code> (eyebrow) against <code>:286-288</code> (h1 title)
WHAT I'LL DO	Keep one of them. The eyebrow keeps the template, the title carries the date and the project - no repeat.
DONE WHEN	No report header shows the same sentence twice.

3 The dashboard stops hiding your work

ME small

WHAT'S WRONG	"Recent reports" and "Overdue items" both load collapsed behind a Show toggle, so the biggest thing on your home screen is the field-app QR block.
WHERE	<code>dashboard.tsx:85</code> - <code>useState(false)</code> governs both sections
WHAT I'LL DO	Give the sections sensible defaults: open when they hold something worth seeing, and keep the toggle for the user.
DONE WHEN	Landing on the dashboard shows the work without a click.

4 All reports gets a create action

ME small

WHAT'S WRONG	The page lists every report and offers bulk delete, but there is no way to start one from it . The empty state tells you to go to the dashboard.
WHERE	<code>reports.index.tsx</code> - 211 lines, no create control
WHAT I'LL DO	Add a New report action in the page header pointing at the one start screen, so the list and the action live together.
DONE WHEN	You can start a report from the list of reports.

5 Test, lint, push - then you publish again

ME same day

WHAT	The four fixes above go in as their own commits, tests and lint run first, then pushed to <code>main</code> .
WHY SEPARATE	Small commits mean any single fix can be reverted on its own without unpicking the rest.
DONE WHEN	Tests green, lint clean, pushed, and I have shown you the commit list.
THEN	You press Publish → Update in Lovable once more.

4 Three things that need your decision, not my guess

6 The two old reports that both say "Reference: 001"

YOU decision

THE FACTS	29 reports on the account. Two still carry the reference 001 . Both were issued before references were built in the database, so they hold the hand-typed value.
WHY IT MATTERS	Two different issued reports are indistinguishable by reference. But a report that has already gone to a client is a record - rewriting it is not a small thing.
YOUR OPTIONS	(a) Leave them and show a small "recorded by hand" note on screen - the wording already exists in the code; (b) reissue them with new references; (c) do nothing.
MY RECOMMENDATION	(a). It is honest, it changes no issued document, and it stops the next person being confused.

7 Delivery webhooks are not configured

YOU needs a URL

WHAT'S WRONG	Settings says "Not configured - bounces will not be recorded" . So when a report email bounces, you never find out.
WHAT I NEED FROM YOU	Where the bounce notifications should land - a provider (Resend, SendGrid, Svix) or an endpoint of your choosing.
WHAT I'LL DO	Build the wiring and the test once I know the destination. I cannot invent the endpoint.
DONE WHEN	A test bounce is recorded and visible.

8 Sign-in emails still come from Supabase's shared sender		YOU needs SMTP
WHAT'S WRONG	Password and sign-in emails go out from Supabase's shared sender rather than your own domain. That reads as less trustworthy to a client, and shared senders get throttled.	
WHAT I NEED FROM YOU	Which route - your own SMTP (for example Resend or SendGrid) plus the DNS records for <code>instructbrain.com</code> .	
WHAT I'LL DO	Wire it, send a test, and show you the headers.	
COST	Small monthly cost depending on volume. I will quote it before anything is signed up to.	

5 Write it up, then prove it

9 IB-WALK-002 - the walk, as a document		ME half a day
WHAT	Last night's read-only walk written up properly: what I did, what I saw, the screenshots, and what each item means for the product. Hosted link and a copy in your Drive. IB-WALK-001 is the existing one.	
WHY	So the findings can be shown to someone else without you narrating them, and so there is a dated record of what was true when.	
DONE WHEN	You have a link that opens on a phone.	

10 Re-walk after you publish		ME same day
WHAT	Signed in as you, read-only, I walk the same screens again and report what actually changed - and what did not.	
WHY	Publishing is the step where things silently go wrong. The plan is only finished when the live site says so.	
DONE WHEN	I can show you each item as fixed or still open, with the evidence.	

Where I would start. Press Publish, then let me take steps 1 to 5 - the four fixes and the push. They are all small, they are all in code I have already read, and one of them is the location confusion that catches you every time you build a report. Steps 6 to 8 need a decision from you and nothing from me until then.

Nothing on this list has been changed yet. No commits beyond `c8a2252`, nothing unpushed, and no product data touched - the walk on Mon 6 Oct was read-only.
