

What I did, and what I actually saw

Signed in as the owner, read-only — six checks, one bug found, nothing changed

ISSUED	OWNER	PRODUCT	BUILD VERIFIED	CI
7 Oct 2026	D. Hopwood	instructBrain	b826212 on main	run 37663006724, green

Everything below was measured on the live site, after your publish. Not read out of the code, not assumed from a green tick. I signed in as you (one-time link, never a password), opened existing records and looked at them. I created, edited, issued and deleted nothing.

1 What I did

Two passes. First the **served bundle**: pulled the 125 JavaScript chunks your site actually delivers and checked the fixed code is in them, rather than in the repository. Then the **screens**: a signed-in walk of the dashboard, the reports list, and two real reports, capturing every screen and logging console errors and any request that came back 4xx or 5xx.

2 The checks, and how each one was proven

1	The location block stops contradicting itself	LIVE	0bb939b
EVIDENCE	The served bundle carries the new copy (Add the location and details for these photographs) and the report screen prints it on a real report, not just in the repository.		
2	The report header stops printing the same words twice	LIVE	1565772
EVIDENCE	The suppression rule is present in the served bundle, and report SNG-2026-10-001 now prints the template name once. Before, the cover stacked the same words above the title.		
3	The dashboard stops hiding your work	LIVE	bd59448 + b826212
EVIDENCE	Both sections open themselves with rows visible: 2 of the two toggles read Hide and none read Show, with 9 links under Recent reports and 5 under Overdue items. This needed a second fix - see below.		
4	A report can be started from the list of reports	LIVE	8654714
EVIDENCE	The New report control is on the page and points at /reports/quick, the one start screen.		
5	The two old reports that both say 001	LIVE	7a2e6a4
EVIDENCE	The hand-recorded note now shows on the screen of report 2e35c5ed - the wording was in the code and never displayed. No issued document was altered.		
6	The walk itself	0 ERRORS	measured
EVIDENCE	No console errors and no failed requests across every screen walked. That is the cleanest signal that nothing regressed while fixing things.		

3 The dashboard, before and after

Before. "Recent reports (8)" was a header strip behind a Show control — eight reports the owner could not see without clicking. Captured on the pre-publish build.

After. The section opens itself with all eight cards visible, and “Overdue items (10)” stays open above it. Same screen, same account, no click.

4 What the walk caught that reading the code did not

The first dashboard fix was only half working, and only the walk showed it. The section was set to open when it held something — but that decision was made once, when the screen loaded, and the count arrives after the screen loads. So “Recent reports (8)” still started collapsed while “Overdue items” opened. Fixed properly in `b826212` : until you touch the toggle the section follows its own count, and once you touch it, your choice is what holds.

This is the whole argument for walking a live product rather than reading its source. The code looked right; the screen was wrong.

5 What this walk does not cover

NO FULL TYPE CHECK EXISTS IN THIS PROJECT	It cannot run on my box - the container is capped at 2 GB and <code>tsc</code> is killed - and the CI workflow deliberately has no typecheck step. What I ran was a check over the changed files, with and without my edits: identical error sets. That is weaker than a full check.
ONE RULE IS PROVEN BY TESTS, NOT BY A SCREEN	The eyebrow is suppressed only when a report's title already opens with the template name. No report created after the relabel exists yet, so that case is covered by six unit tests rather than by looking at a live page.
ISSUING A REPORT AND THE EMAILED PDF WERE NOT EXERCISED	By design: this was a read-only walk. Nothing was created, edited, issued or deleted, so the issue action and the delivery path are unchanged and unproven by this walk.
DESKTOP WIDTH ONLY	Measured at 1440 px. Phone widths were not walked, so the narrow-screen wrapping of the new New report control is asserted from the code, not observed.
A POINT-IN-TIME RECORD	Everything here was true on 7 Oct 2026. The live site will move on; this document will not.

6 Still waiting on you

Unchanged by this walk, and listed so it stays visible: **where delivery bounces should be reported** (a provider or an endpoint — I cannot invent the destination); **the sign-in email sender** — my recommendation is Supabase Auth pointed at Resend, which costs nothing; and **whether the two reports still showing reference 001 should be reissued** (my recommendation: leave them, they are a record of what was issued).

No database row was changed and no document was issued or altered. Where a claim rests on a test rather than a screen, it says so above.
