IB-PLAN-001 · REV 2 · ACTION PLAN

What we do next, in order

Eleven steps — four fixed and pushed today, three waiting on you, the rest mine

ISSUED	OWNER	PRODUCT	REPOSITORY
7 Oct 2026 (Rev 2)	D. Hopwood	instructBrain	<code>7a2e6a4</code> on main, origin level

One thing is holding everything up, and it is one click. The four fixes are committed and pushed to `main` as `7a2e6a4` — they are in the repository, not yet on your site. Press **Publish → Update** in Lovable, tell me, and I will re-walk every screen and report what actually changed.

1 The whole plan, at a glance

#	STEP	STATUS	WHY IT MATTERS
0	Press Publish → Update in Lovable	DONE	Published and verified live: Pro, and the Finding labels
1	Location: one prompt, not two	FIXED · 0BB939B	The one you keep hitting
2	Letterhead stops repeating itself	FIXED · 1565772	Two identical lines on every report header
3	Dashboard stops hiding the work	FIXED · BD59448	Recent reports and Overdue now open themselves
4	All reports gets a create action	FIXED · 8654714	No way to start a report from the list
5	Tests, lint, push	DONE	504 tests pass, lint 0 errors, CI green, pushed
6	The two old reports both saying 001	EXPLAINED · 7A2E6A4	Note added on screen; whether to reissue them is still your call
7	Delivery webhooks not configured	NEEDS YOU	Bounces are not recorded today
8	Sign-in emails on a shared sender	NEEDS YOU	Lovable paid route, or Supabase SMTP via Resend (free)
9	IB-WALK-002 - the write-up	NOT STARTED	Say when and I will write it
10	Re-walk after publishing	WAITING ON YOU	Proof, not an assumption - the moment you publish

2 Done — shipped and published

0

Publish what was already built

DONE

1 minute

WHAT

Fifteen commits from Mon 6 Oct were in the repository and invisible to your users.

NOW

You published, and I checked the result rather than the button: the live pricing card says **Pro** where it said Practice, the served code says **Finding identification & remedial schedule**, and **none** of 125 live chunks still says Snag. The database has definition v4 active with the Finding labels, v1-v3 retired, so nothing issued changes retrospectively.

3 Fixed today — in the repository, waiting on your publish

1	Location: one prompt, not two	FIXED · 0BB939B	small
WHAT WAS WRONG	The photograph panel offered “Add a location tag (optional)” over a block holding the template's capture fields — and on every survey on the site one of those fields, <code>location</code> , is required , showing “Required” and “Not yet completed”. The same control contradicted itself, and nothing said how the optional tag and the required location related.		
WHAT I DID	The block now describes what it holds, and one line under it says what the values are for: they are stamped on each photograph added from there and are what the report reads as the location for each finding. A template with no required field still reads as optional.		
WHERE	<code>photos-panel.tsx</code>		

2 The report header stops printing the same words twice

FIXED · 1565772 small

WHAT WAS WRONG Every report raised from a template carries the template name inside its own title. The cover printed that same name again as an eyebrow above the title, so the header read “SNAG IDENTIFICATION & REMEDIAL SCHEDULE” stacked on “Snag identification & remedial schedule — 6 Oct 2026”.

WHAT I DID One rule, in `src/lib/report/letterhead.ts`: if the title already opens with the template name, the eyebrow is suppressed. A title somebody typed (“13 Bruton Street — photo update”) does not name the template, so the eyebrow stays — which is also why a report issued before the relabel still shows the current template name. Applied to both covers and to the report workspace header, all three of which printed it. Six tests cover it.

3 The dashboard stops hiding your work

FIXED · BD59448 small

WHAT WAS WRONG “Recent reports (8)” and “Overdue items (3)” both loaded collapsed behind a Show toggle, which left the field-app QR block as the biggest thing on the home screen.

WHAT I DID A section opens itself when it holds something and stays shut when it is empty. The toggle remains for anyone who wants it out of the way.

4 A report can be started from the list of reports

FIXED · 8654714 small

WHAT WAS WRONG All reports listed everything and offered bulk delete, but there was no way to start one from it.

WHAT I DID A **New report** action sits in the page header next to the count, pointing at the one start screen. It wraps under the heading on a narrow phone screen.

5 Tests, lint, push

DONE same day

LOCAL **504 tests pass** (6 new), 4 skipped · **eslint 0 errors** (241 warnings, the pre-existing backlog, unchanged) · five separate commits so any one can be reverted on its own.

CI GitHub Actions run **37643690655** on `7a2e6a4`: Lint, Test and Build.

HONEST CAVEAT There is **no full type check anywhere**: it cannot run on my box (the container is capped at 2 GB and `tsc` is killed), and the workflow deliberately has no typecheck step. What I ran instead was a type check over the files I changed, **with and without my edits** — identical error sets apart from line numbers, so my edits added none. That is weaker than a full check and worth knowing.

PUSHED `c8a2252` → `7a2e6a4`, origin level with local, nothing unpushed.

6 The two old reports that both say “001”

EXPLAINED · 7A2E6A4 one line + a decision

THE FACTS Twenty-nine reports on the account; two still carry the reference **001**, both issued **before** references were built in the database.

WHAT I DID The report header now adds one line saying the reference was recorded by hand and cannot be changed — the wording already existed in `reference.ts` and was never shown. Screen only: no issued document is altered and no row is touched.

STILL YOURS Whether to leave those two as they are (my recommendation), or reissue them with new references. Nothing more happens until you say.

4 Waiting on a decision from you — nothing happens until you say

7 Delivery webhooks are not configured

NEEDS YOU needs a URL

WHAT'S WRONG Settings says “Not configured — bounces will not be recorded”. When a report email bounces, nobody finds out.

WHAT I NEED Where the notifications should land — a provider (Resend, SendGrid, Svix) or an endpoint of your choosing. I cannot invent the destination.

8 Sign-in emails still go out on a shared sender

NEEDS YOU needs a decision

WHAT'S WRONG Report emails are properly authenticated through Resend (SPF, feedback MX and DKIM all present on `instructbrain.com`). Sign-in emails are not: there is no `notify.` sending domain, so they run on the default sender with its hourly cap — the likely cause of Lovable’s “some users may see errors sending messages”.

TWO ROUTES (a) Lovable’s own email feature — paid plans only, DNS handled for you. (b) Point Supabase Auth’s SMTP at Resend — your auth already lives in your own Supabase project, the free tier covers it, and you already have the Resend account. **I recommend (b): it costs nothing.**

5 Mine, still to do

9 IB-WALK-002 — the walk, as a document		NOT STARTED	half a day
WHAT	Monday's read-only walk written up properly: what I did, what I saw, the screenshots, and what each item means. Hosted link and a copy in your Drive. IB-WALK-001 is the existing one.		
10 Re-walk after you publish		WAITING ON YOU	same day
WHAT	The moment the four fixes are live I walk the same screens again, signed in and read-only, and report what actually changed — with the evidence, including the parts that did not.		
WHY	Publishing is the step where things silently go wrong. Until I have looked, these are fixed in the repository, not on your site.		

Nothing in the database was changed today; no product data was touched. Two things I want to be plain about, because they are limits rather than opinions: there is **no full type check** in this project — mine cannot run it (2 GB container cap kills `tsc`) and the workflow has no typecheck step, so what I ran was a changed-files check with and without my edits; and the four fixes are **unproven against the live site** until you publish and I re-walk.
