

What we do next, in order

Published, verified on the live site and written up — three decisions left with you

ISSUED	OWNER	PRODUCT	REPOSITORY	CI
7 Oct 2026 (Rev 3)	D. Hopwood	instructBrain	b826212 on main, origin level	run 37663006724, green

Everything fixed is now published and checked on the live site — and that is where the last bug was found. Rev 2 said four fixes were sitting in the repository waiting on a publish. They are live, verified in the code your site serves *and* on the screens, signed in read-only. The one thing reading the code could not tell us was that the first dashboard fix only half worked; walking it did. That is fixed, confirmed, and written up.

1 The whole plan, at a glance

#	STEP	STATUS	WHY IT MATTERS
0	Press Publish → Update in Lovable	DONE	Published twice today; both checked on the live site, not on the button
1	Location: one prompt, not two	LIVE · 0BB939B	The one you keep hitting
2	Letterhead stops repeating itself	LIVE · 1565772	Two identical lines on every report header
3	Dashboard stops hiding the work	LIVE · BD59448 + B826212	Two commits: the sections open themselves, and they open when the count arrives
4	All reports gets a create action	LIVE · 8654714	No way to start a report from the list
5	Tests, lint, push	DONE	504 tests pass, lint 0 errors, CI green on b826212
6	The two old reports both saying 001	EXPLAINED · 7A2E6A4	Note now shows on screen; reissuing them is still your call
7	Delivery webhooks not configured	NEEDS YOU	Bounces are not recorded today
8	Sign-in emails on a shared sender	NEEDS YOU	Lovable paid route, or Supabase SMTP via Resend (free)
9	IB-WALK-002 — the walk, as a document	DONE	Two pages, before and after, hosted and filed
10	Re-walk after publishing	DONE	Six checks, one bug caught and fixed, nothing changed

2 Published, and verified at the source

0	Published - and verified at the source, not at the button	DONE	done
WHAT WAS WRONG	Fifteen commits from Mon 6 Oct were in the repository and invisible to your users.		
NOW	You published. I then checked the result : the live pricing card says Pro where it said Practice, the served code says Finding identification & remedial schedule , none of 125 live chunks still says Snag, and the database holds definition v4 active with v1–v3 retired - so nothing already issued changes retrospectively.		

3 Live on your site now

1	Location: one prompt, not two	LIVE · 0BB939B	small
WHAT WAS WRONG	The photograph panel offered “Add a location tag (optional)” over a block holding the template’s capture fields — and on every survey on the site one of those fields, <code>location</code> , is required . The same control contradicted itself.		
WHAT I DID	The block now describes what it holds, and one line says what the values are for: they are stamped on each photograph added from there, and are what the report reads as the location for each finding.		
PROOF IT IS LIVE	The wording is in the bundle your site serves, and prints on a real report screen. Not just in the repository.		

2 The report header stops printing the same words twice

LIVE · 1565772 small

WHAT WAS WRONG	Every report raised from a template carries the template name inside its own title, and the cover printed that name again as an eyebrow above it.
WHAT I DID	One rule in <code>src/lib/report/letterhead.ts</code> : if the title already opens with the template name, the eyebrow is suppressed. Six tests cover it.
PROOF IT IS LIVE	Report SNG-2026-10-001 carries the name once . The one case not proven on a screen — a title somebody typed, where the eyebrow stays — is covered by tests, because no report created since the relabel exists yet.

3 The dashboard stops hiding your work

LIVE · BD59448 + B826212 two commits

WHAT WAS WRONG	"Recent reports (8)" and "Overdue items" loaded collapsed behind a Show toggle, which left the field-app QR block as the biggest thing on the home screen.
FIRST FIX	bd59448 — a section opens itself when it holds something, and stays shut when it is empty.
WHAT THE WALK CAUGHT	The first fix worked at the moment the screen loaded, and the count arrives <i>after</i> that. So "Recent reports (8)" still started collapsed while "Overdue items" opened. Reading the code said it was fixed; the screen said otherwise.
SECOND FIX	b826212 — until you touch the toggle the section follows its own count; once you touch it, your choice holds. Confirmed on the live site: both sections open, 2 toggles reading <i>Hide</i> and none reading <i>Show</i> .

4 A report can be started from the list of reports

LIVE · 8654714 small

WHAT WAS WRONG	All reports listed everything and offered bulk delete, but there was no way to start one from it.
WHAT I DID	A New report action sits in the page header, pointing at the one start screen. On the live site it is there and points at <code>/reports/quick</code> .

5 Tests, lint, push

DONE same day

LOCAL	504 tests pass (6 new), 4 skipped · eslint 0 errors (241 warnings, the pre-existing backlog, unchanged) · small separate commits so any one can be reverted on its own.
CI	GitHub Actions run 37663006724 on b826212 : Lint, Test and Build, all green.
HONEST CAVEAT	There is no full type check anywhere in this project: it cannot run on my box (a 2 GB container kills <code>tSC</code>) and the workflow deliberately has no typecheck step. What I ran instead was a type check over the changed files, with and without my edits — identical error sets. That is weaker than a full check and worth knowing.

6 The two old reports that both say "001"

EXPLAINED · 7A2E6A4 one line + a call

THE FACTS	Two reports still carry the reference 001 , both issued before references were built in the database.
WHAT I DID	The report header now adds one line saying the reference was recorded by hand and cannot be changed. Screen only: no issued document is altered.
PROOF IT IS LIVE	The line shows on report 2e35c5ed .
STILL YOURS	Leave those two as they are (my recommendation - they are a record of what was issued), or reissue them with new references. Nothing happens until you say.

4 The record of the walk

IB-WALK-002 is the walk written up: what was checked, how each claim was proven, the dashboard before and after, what the walk caught, and - on the face of the document - what it does **not** cover. Two pages, hosted permanently, filed in your Drive.

IB-WALK-002 — post-publish verification walk

<https://darrenhopwood13-maker.github.io/instructbrain-plan/walk/>

Scan the code, or tap the link. Screenshots are real captures, not mock-ups.

5 Waiting on a decision from you — nothing happens until you say

7 Delivery webhooks are not configured

NEEDS YOU needs a URL

WHAT'S WRONG	Settings says "Not configured — bounces will not be recorded". When a report email bounces, nobody finds out.
WHAT I NEED	Where the notifications should land — a provider (Resend, SendGrid, Svix) or an endpoint of your choosing. I cannot invent the destination.

WHAT'S WRONG	Report emails are properly authenticated through Resend (SPF, feedback MX and DKIM all present on <code>instructbrain.com</code>). Sign-in emails are not: there is no <code>notify.</code> sending domain, so they run on the default sender with its hourly cap.
TWO ROUTES	(a) Lovable's own email feature — paid plans only, DNS handled for you. (b) Point Supabase Auth's SMTP at Resend — your auth already lives in your own Supabase project, the free tier covers it, and you already have the Resend account. I recommend (b): it costs nothing.

No database row was changed and no issued document was altered today. Limits worth stating plainly: there is **no full type check** in this project; the eyebrow rule is proven by tests rather than by a screen, because no report created since the relabel exists yet; the walk was **desktop-width and read-only**, so the issue action and the emailed PDF remain unexercised by it.
